WEBSITE REDESIGN · EXPLAINER

WHY IT'S BUILT THIS WAY

A walkthrough of the full front-end rebuild — the design direction, the system behind it, and a page-by-page look at what changed and why, prepared for client review.

01 — WHAT CHANGED

A rebuild, not a repaint.

The brief was explicit: don't restyle the existing pages — rethink the site from the ground up the way a digital agency would for a company entering the international market, while keeping the real brand, real content, and real business functionality intact. That's what this covers.

01 **New design system**

A full token set — type scale, spacing scale, motion, color — built on the existing navy/red/gold brand, plus reusable components (buttons, section headers, stat rows, scroll-reveal) used consistently across every page instead of one-off styling per section.

02 **New navigation and footer**

The old site had two separate, duplicated navigation implementations (one for the homepage, one for every other page). Rebuilt as a single sticky nav with a grouped mega-menu for Services, plus a redesigned footer with a real sitemap instead of dead links.

03 **New homepage information architecture**

Reordered around what an international visitor needs to understand in the first 10–20 seconds: who we are, what we do, where we work, how we operate safely, then proof (gallery, news, careers).

04 **One template instead of fourteen pages**

Every drilling and mining service page — plus Health, Environment and Quality Management — was its own hand-built page with duplicated layout code. They're now one data-driven template, so the design stays consistent and future content edits happen in one place.

05 **Trust signals**

An ISO-certification badge on the homepage and footer, plus a persistent certification seal, reinforcing the real ISO 9001 / 14001 / 45001 certifications already listed on the Investors page.

02 — DESIGN DIRECTION

Who this has to convince.

A mining and drilling contractor's website is rarely read by a retail customer. It's read by investors, mining houses vetting a contractor, regulators, and prospective hires. That audience decides the visual language.

Global operators converge on a shared visual grammar for exactly this reason: a dominant dark ground, one disciplined accent color, bold condensed headline type, large equipment photography treated with a scrim for legibility, and key figures presented as plain stat rows rather than decorated widgets. It reads as scale and operational seriousness to the audience that matters here.

BHP · Rio Tinto · Barrick Gold · Anglo American · Newmont · Glencore

None of these were copied — the point was to understand the pattern language, then build something original on Amazon Mineworks' own navy/red/gold brand rather than a generic mining palette.

> **The governing principle: quiet confidence.** Minimal color, strong typography, real photography, generous whitespace. No card grids for the sake of card grids, no gradients competing with the brand red, no stock-photo collages. If a section can say more with a well-set headline than with a decorated box, it does.

03 — DESIGN SYSTEM

Color, used deliberately.

The palette is the logo's own colors, formalized into a system instead of the half-dozen ad-hoc hex values the old stylesheets had scattered through them. Red is reserved almost entirely for calls to action, so it stays meaningful instead of decorative.

Navy	Navy 700	Navy 900	Red	Gold
#000154	#0a1a6b	#00012e	#da0b19	#c8a24a

Navy carries every dark section — nav, footer, safety callouts. **Red** is the single call-to-action color: buttons, active links, hover states, key stats — never used for large fills. **Gold** is a restrained accent for icons, dividers and hover states on dark backgrounds, chosen so it doesn't compete with the red CTA color. Everything else — body text, card backgrounds, dividers — comes from a neutral scale (ink, slate, muted, paper) so color stays purposeful rather than decorative.

Typography

DISPLAY — OSWALD 600 — HEADINGS, NAV, BUTTONS, STATS

MINING & DRILLING SERVICES

BODY — INTER 400/600 — PARAGRAPHS, UI TEXT

We provide full-service mining, drilling, maintenance and geochemical analysis solutions to customers within the minerals industry.

Oswald is condensed and industrial — it carries most of the visual identity so the site doesn't need to lean on decoration to feel considered. Inter stays out of the way at body sizes, which matters across the amount of technical and investor-facing text this site carries.

Background patterns, not flat fills.

Rather than leaving every navy section a flat color, dark sections carry one of four restrained, industry-themed patterns — all pure CSS gradients, so there are no image files to load and they stay perfectly crisp at any screen size.

Drill / Blast-Hole Grid

An even dot grid referencing a blast-hole layout plan. Used on CTA bands, the safety callout, and the Investors contact section.

Survey Blueprint Grid

Fine crossed hairlines like an engineering site plan. Used in the footer body and the mobile navigation drawer.

Topographic Contours

Concentric elevation rings, like a terrain survey map. Used on the "Where We Work" geography section and the homepage hero.

Hazard Stripe Accent

A restrained 5px diagonal gold strip — a nod to hazard tape, used only as a thin top-edge accent on the safety callout, never as a fill.

Each pattern is assigned by theme, not at random — geography sections get contours, technical/CTA sections get the drill grid, the site-wide foundation (footer) gets the blueprint grid. All render at 5–10% opacity under existing gradients and text, so legibility is untouched, and everything respects reduced-motion and remains screen-reader-neutral.

04 — GLOBAL COMPONENTS

What's shared across every page.

Four components appear on every page site-wide. Getting these right once matters more than any individual page, since they're what a visitor sees regardless of entry point.

Navigation

A slim utility bar (phone, email, region, social, "Request a Quote") sits above a sticky main nav. Services opens as a grouped mega-menu — Drilling Services and Mining Services as separate columns — instead of one long 11-item dropdown. Fully keyboard-navigable: dropdowns open on focus as well as hover, and Escape closes any open menu or the mobile drawer.

Footer

Leads with a CTA band ("Partner with a trusted mining & drilling contractor"), then a real sitemap organized by Company / Services / Investors / Get in Touch, replacing the old footer's placeholder "#" links.

Inner-page hero

Every non-homepage page opens with the same editorial banner treatment — large title, breadcrumb, real site photography with a navy scrim — so navigating the site never feels like crossing between different products.

Trust badges

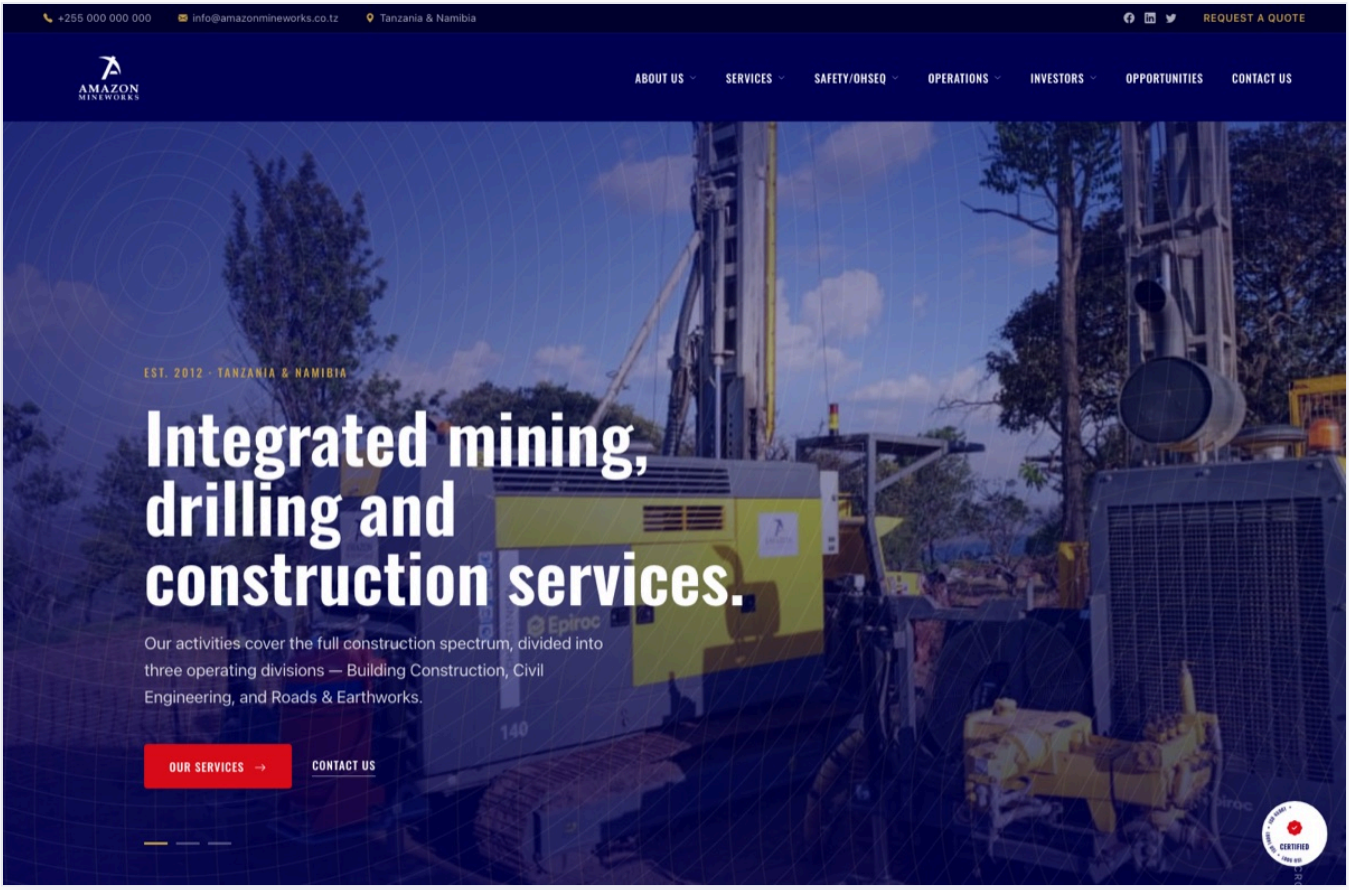

An "ISO Certified" tag on the homepage and footer, plus a fixed circular seal (bottom-right, present while scrolling on every page) showing ISO 9001 / 14001 / 45001 — both link through to the full certification list on the Investors page.

05 — PAGE WALKTHROUGH

Homepage

/

A rotating full-bleed hero (real site photography, topographic pattern in the scrim) leads with a positioning statement rather than "Welcome to Amazon Mineworks." Below it, the page follows a deliberate order: who we are & scale (with the ISO badge and real stats) → capabilities → where we operate → safety & values → gallery → news → careers → FAQ. The footer's CTA band closes the page, so there's no repeated "contact us" banner stacked on top of it.

WHY THIS ORDER

Matches what an international visitor needs in the first 10–20 seconds, before asking them to read anything technical.

CAPABILITIES

An editorial numbered list, not a 4-card grid — each row links straight to its service.

STATS

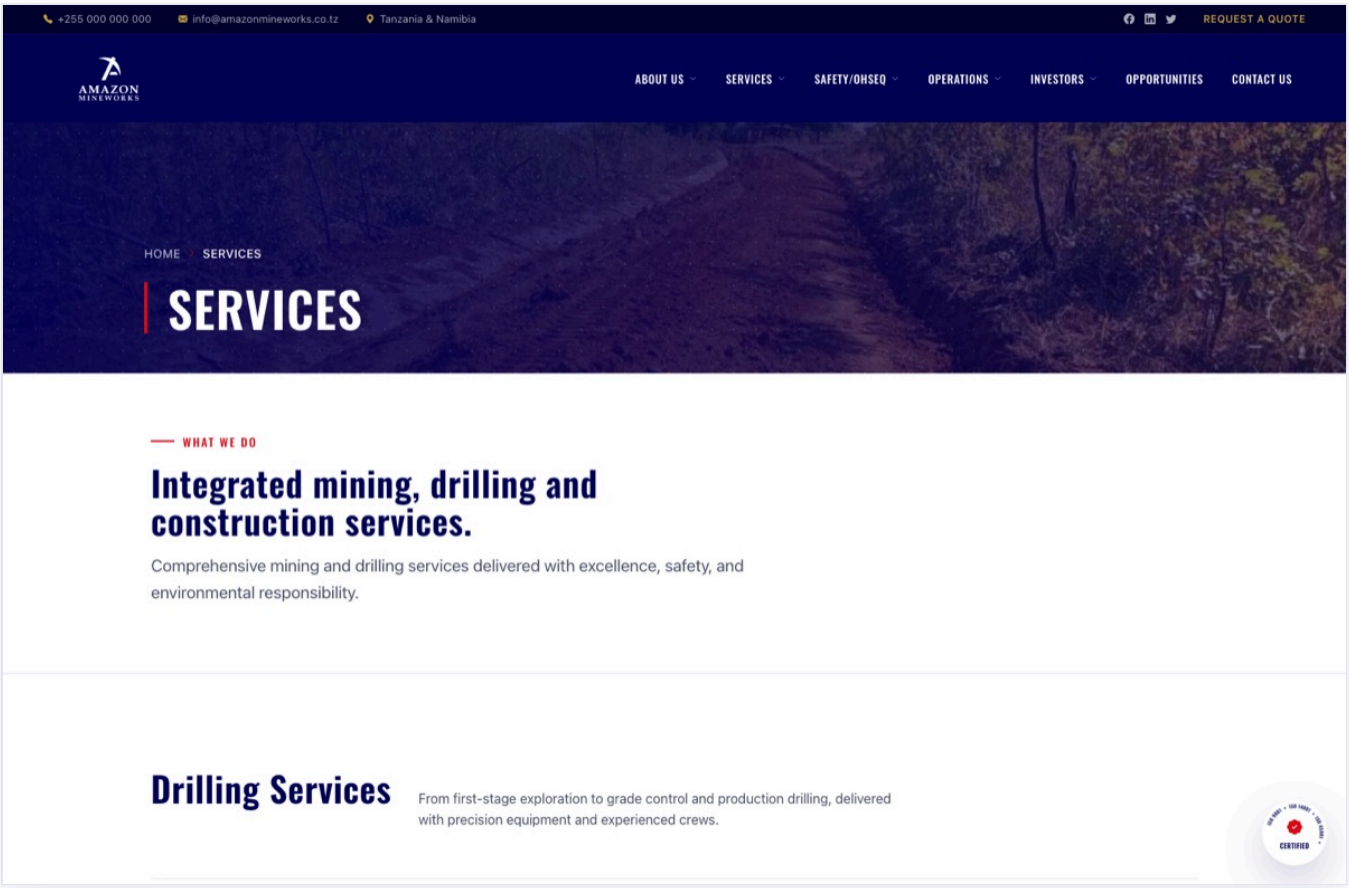

Only real, existing figures are shown (founded 2012, 5 subsidiaries, 1,210+ employees) — nothing invented.

05 — PAGE WALKTHROUGH

Services Hub

/services

Grouped exactly as the business is structured — Drilling Services, Mining Services, Safety & OHSEQ — as three editorial lists rather than one undifferentiated grid of 15 cards. Every row links straight to its dedicated page.

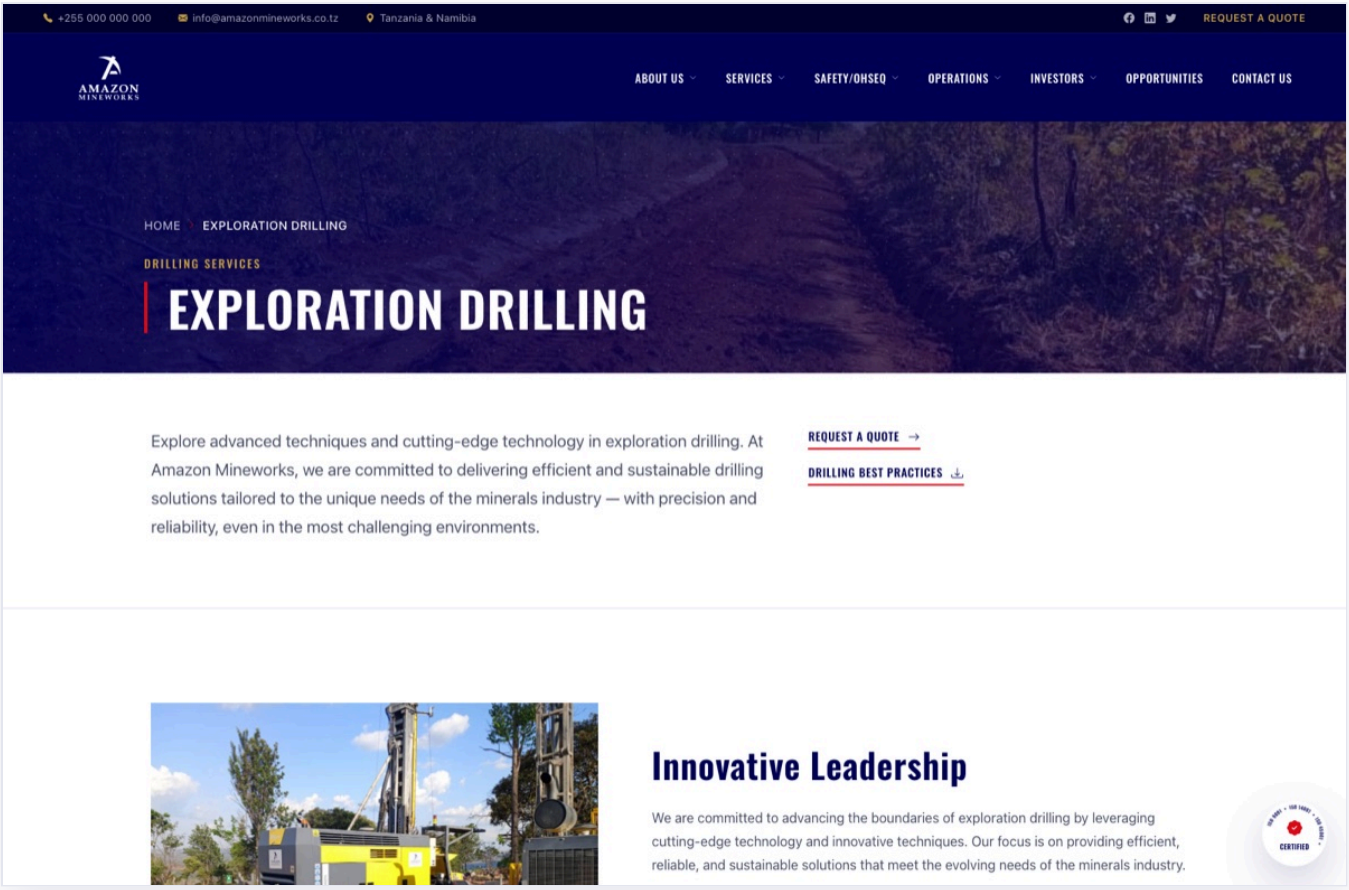

05 — PAGE WALKTHROUGH

Service Detail Template

/exploration-drilling + 13 more

This is the single biggest structural change on the site. Each of the 11 drilling and mining service pages, plus Health, Environment and Quality Management, used to be a separate hand-built page — 14 pages, 14 separate layouts, drifting out of sync with each other over time. They're now one data-driven template: real service content (features, equipment specs, past projects, certifications) is stored as structured data, and the template renders it consistently. Editing a service's copy is now a data change, not a page rebuild.

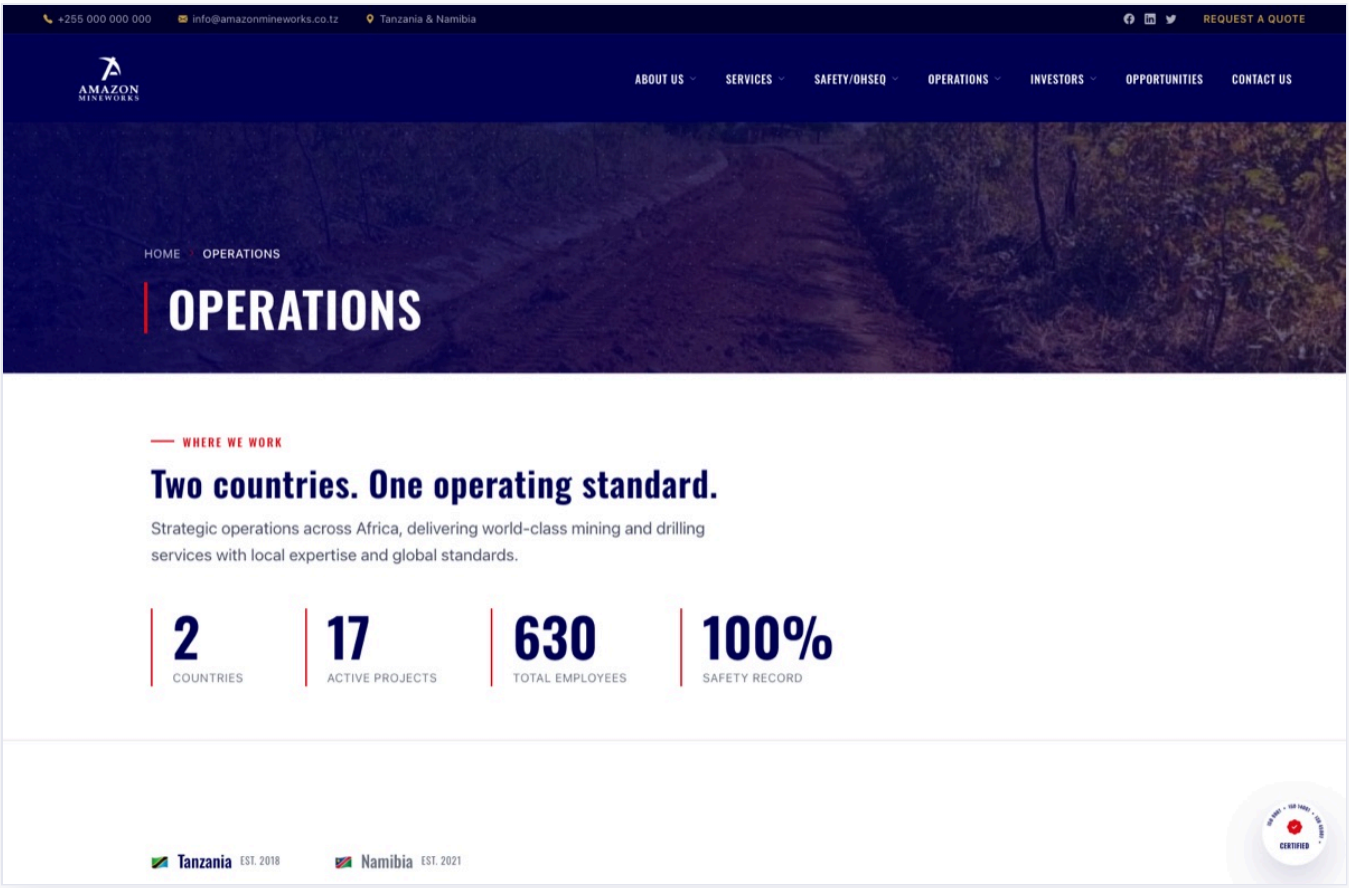

05 — PAGE WALKTHROUGH

Operations

/operations

Tanzania and Namibia as a tab switcher rather than two separate pages, each showing real project history (Geita, Bulyanhulu, North Mara, Rössing, Namdeb), facility lists, and location-specific safety records. The tabs are deep-linkable from the nav (`/operations#tanzania`), so a menu link lands directly on the right country.

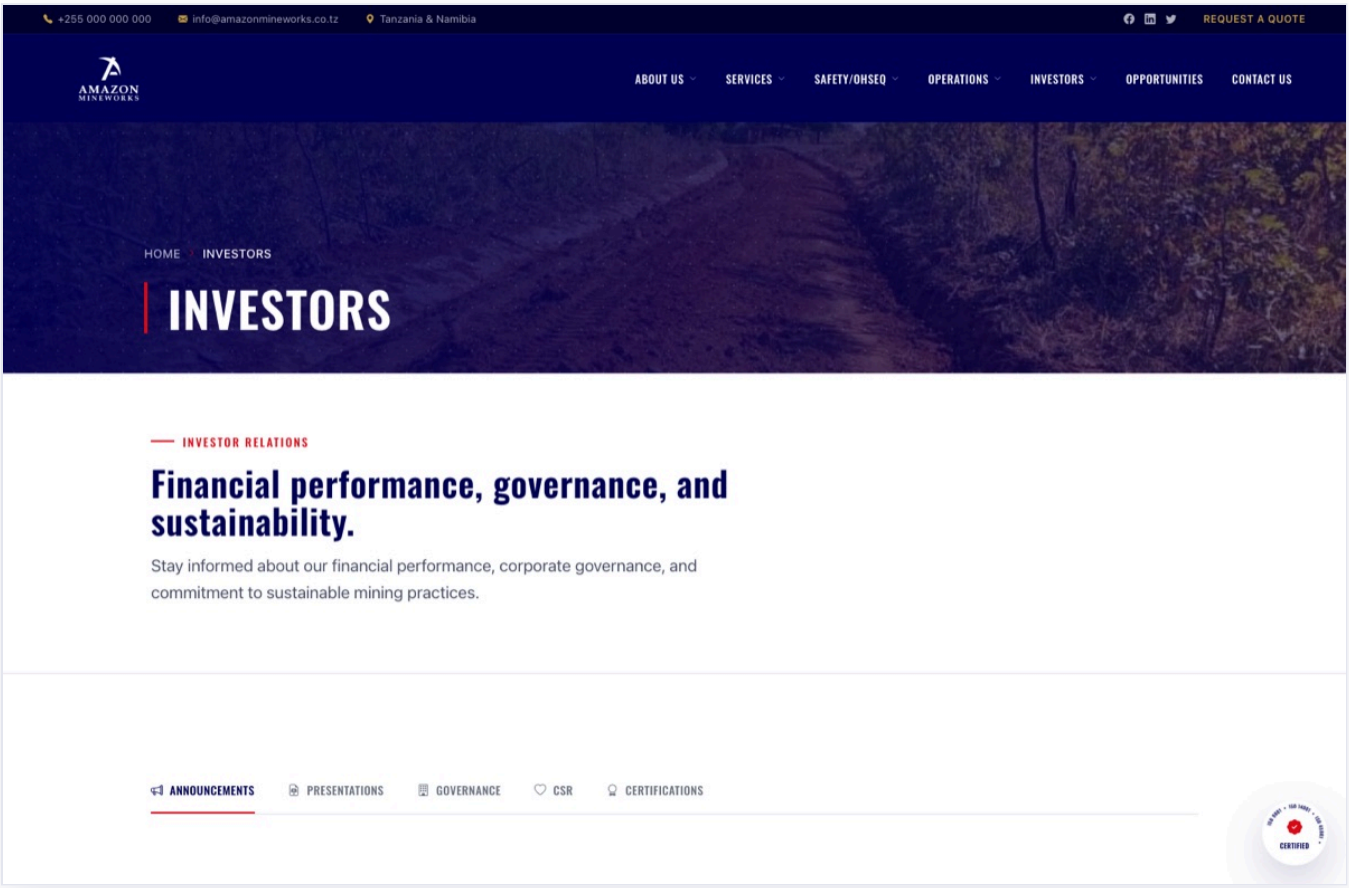

05 — PAGE WALKTHROUGH

Investor Relations

/investors

Announcements, Presentations, Governance, CSR and Certifications as tabs, each deep-linkable via a query parameter, so the Investors nav submenu can send a visitor straight to Certifications without them hunting for it.

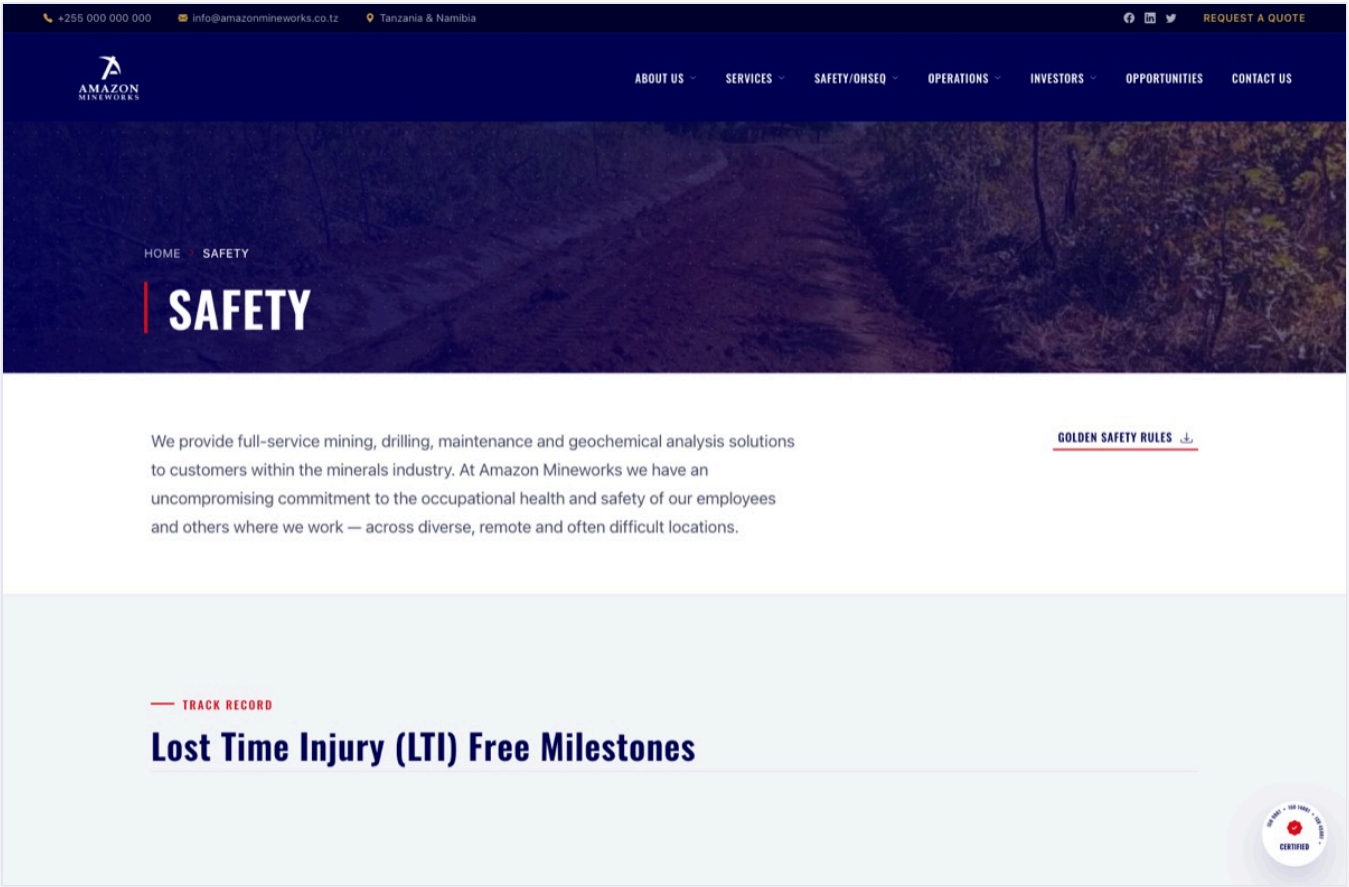

05 — PAGE WALKTHROUGH

Safety & OHSEQ

/safety

Leads with Lost-Time-Injury-free milestones by site (16 years at the Mwanza facility, 7 at North Mara, 6 at Geita), then two editorial story sections on safety leadership and how the workforce is protected day to day, then ten named safety programs (Golden Safety Rules, Safety Risk Leadership Walks, the Class 1 Risk Program, ICAM incident investigation, and others) presented as a clean editorial list rather than icon cards.

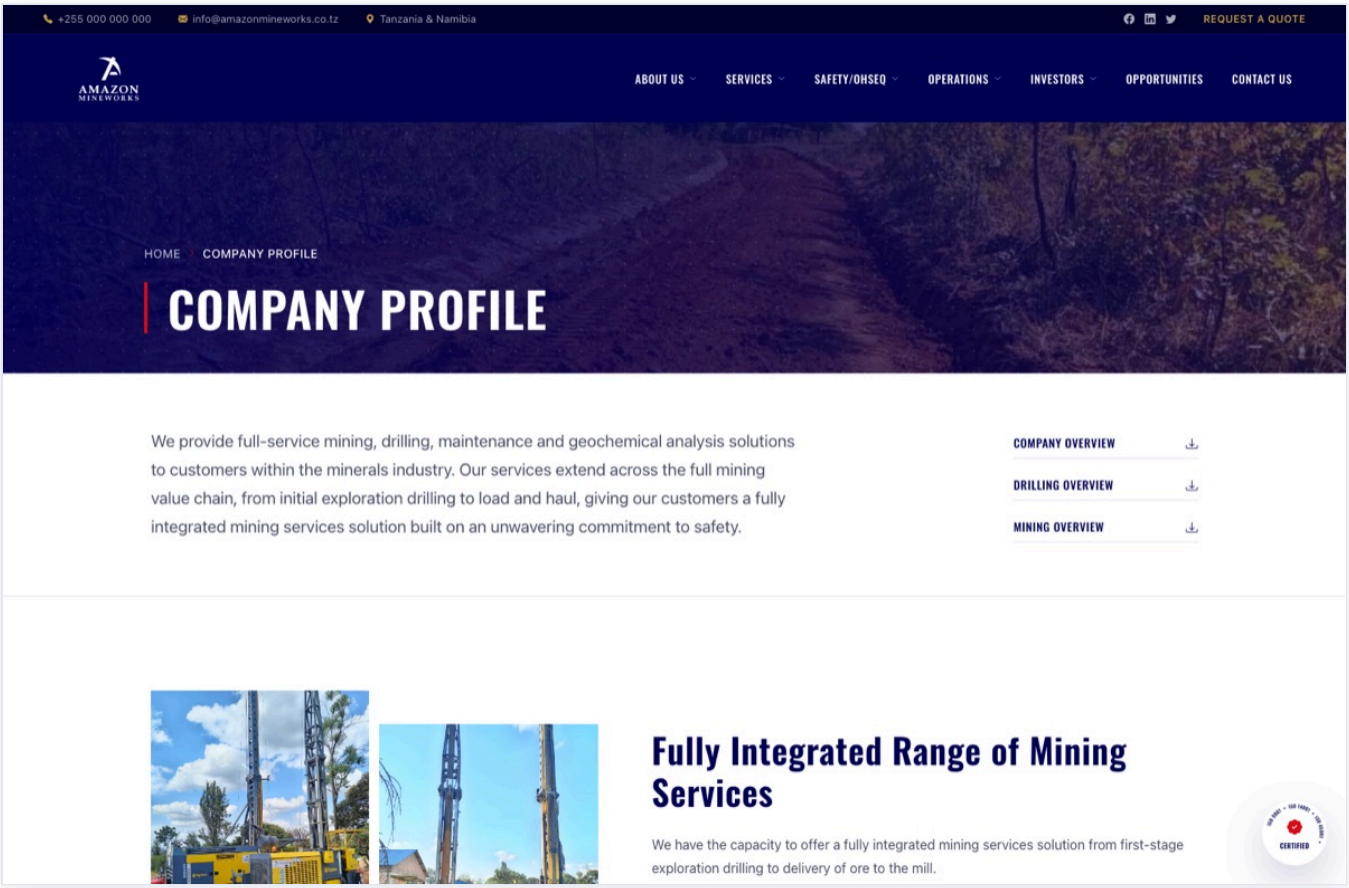

> **A correction made here:** the original milestone list mixed in sites in Mali, Guinea, Saudi Arabia and Egypt — countries the company doesn't operate in anywhere else on the site. That was leftover content from a different company's template. It's been trimmed to the Tanzania sites that match the rest of the site's real footprint. See the content-integrity notes later in this document.

05 — PAGE WALKTHROUGH

Company Profile

/company-profile

An overview statement, then alternating photo/text story blocks — capabilities, the equipment fleet (real specs: 834/D9/D10T bulldozers, 785/777 dump trucks), construction disciplines, career development, community support — closing with the trusted-by partner strip (Barrick, BHP, Shanta Gold and others).

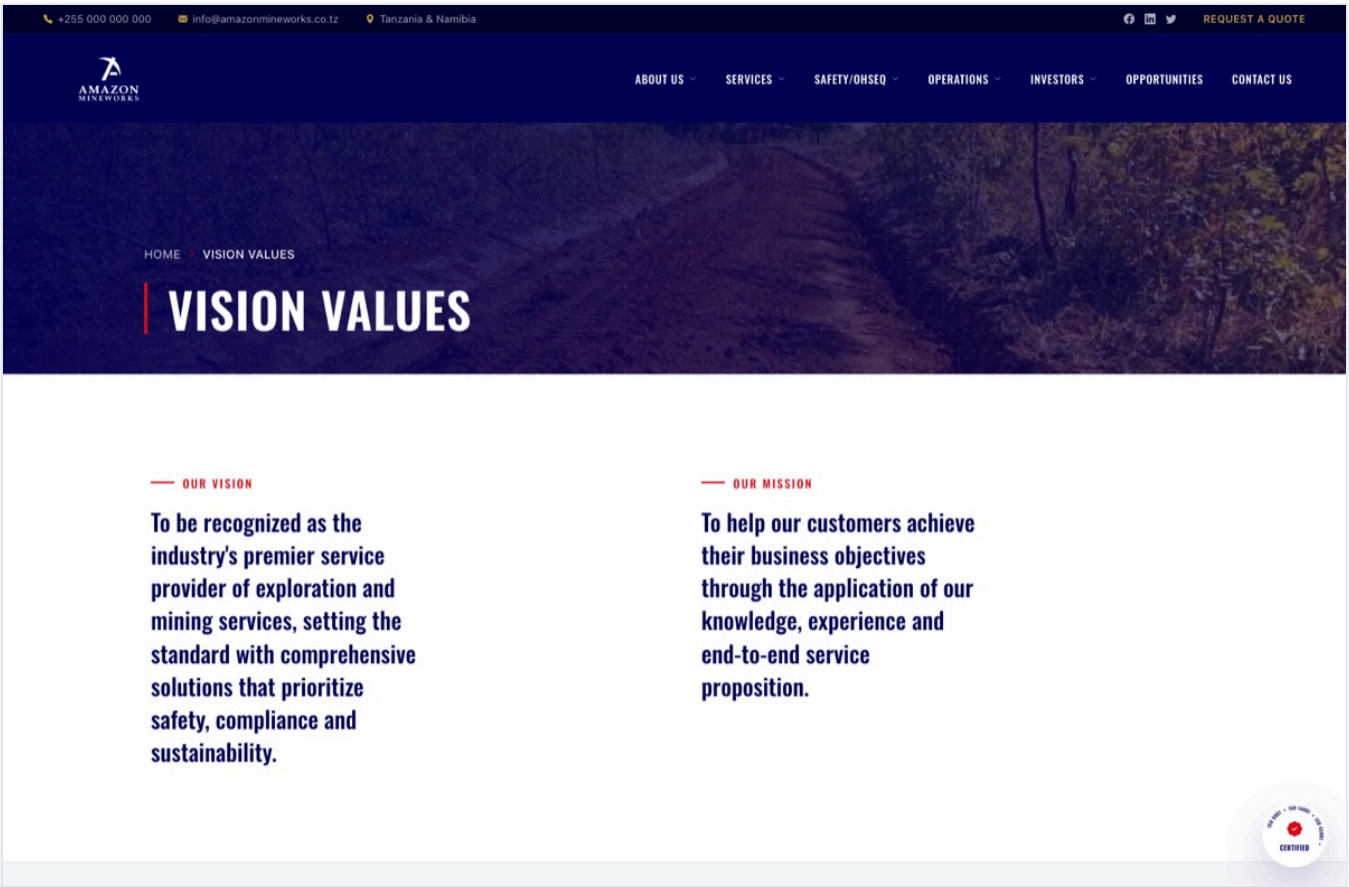

05 — PAGE WALKTHROUGH

Vision & Values

/vision-values

Vision and mission as a two-column opening statement, then the six core values (Safety, Respect, Unity, Integrity, Sustainability, Excellence) as a numbered editorial list rather than six identical icon cards.

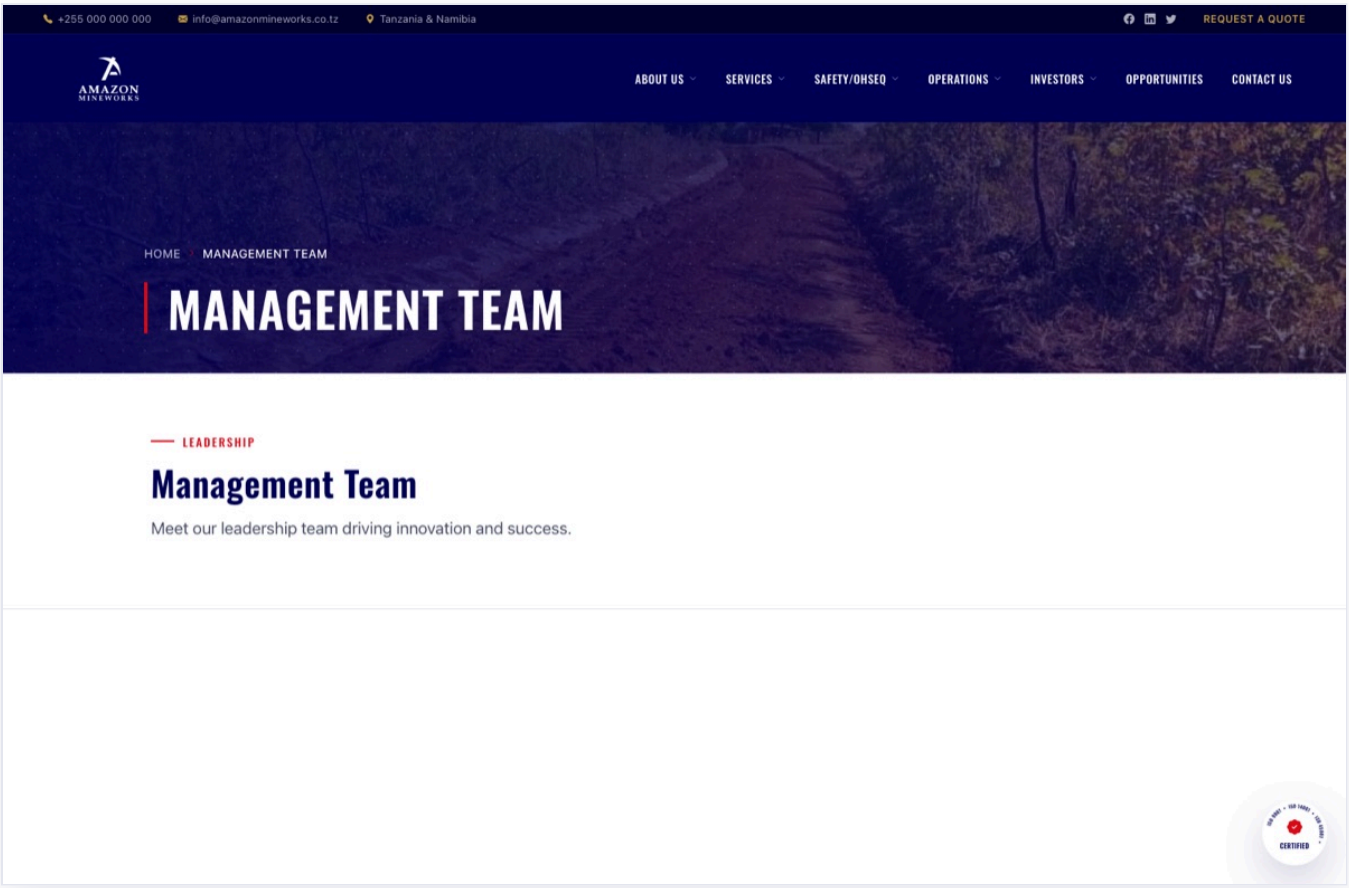

05 — PAGE WALKTHROUGH

Management Team

/management-team

A clean leadership grid — photo, name, role, short bio. The current entries are placeholder data already in the project; see the next-steps section later in this document for replacing these with real leadership photos and bios.

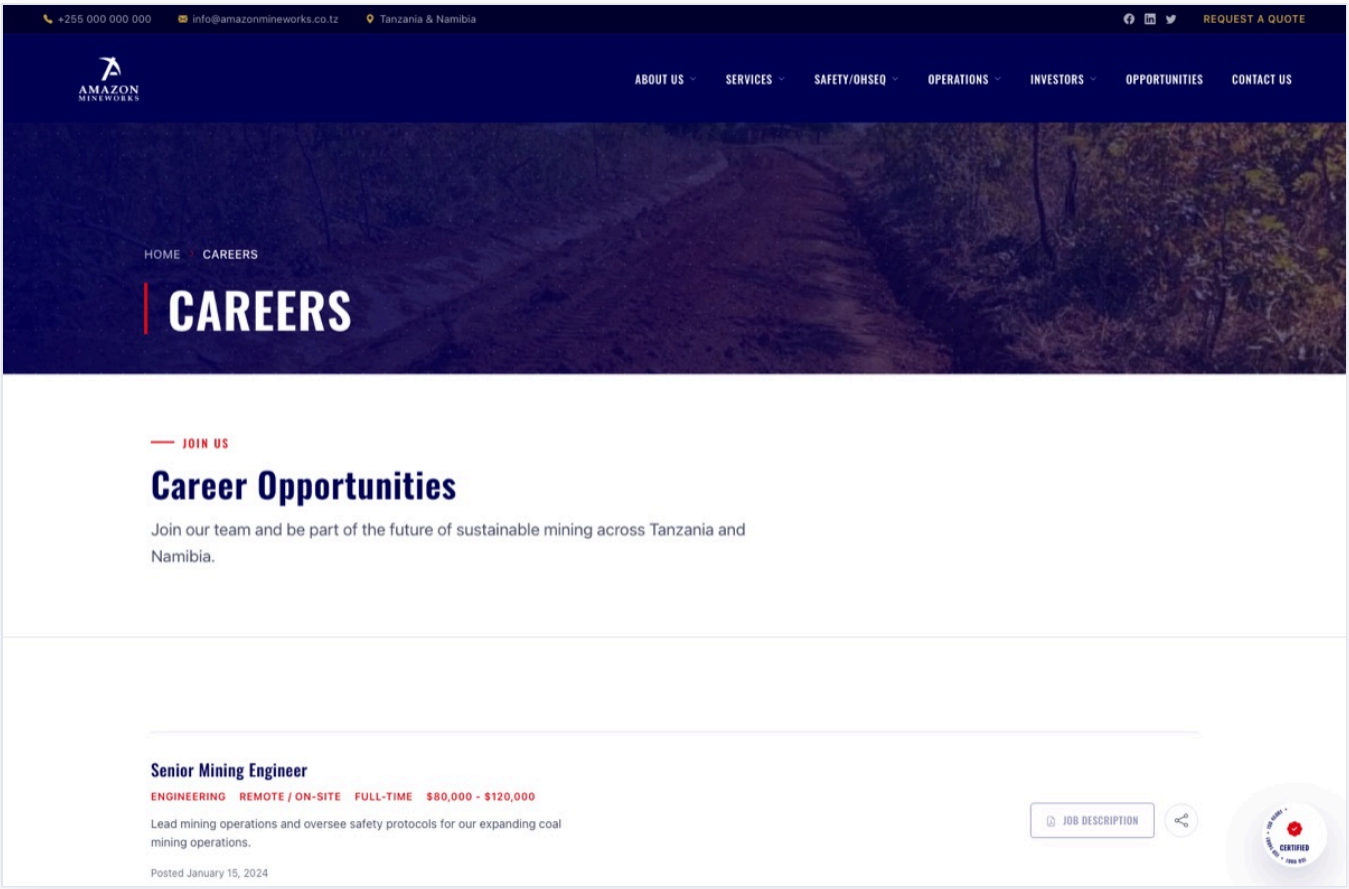

05 — PAGE WALKTHROUGH

Careers

/careers

Live job listings pulled from the existing jobs data, each with a downloadable job description and a native share action — fully functional, not a static list.

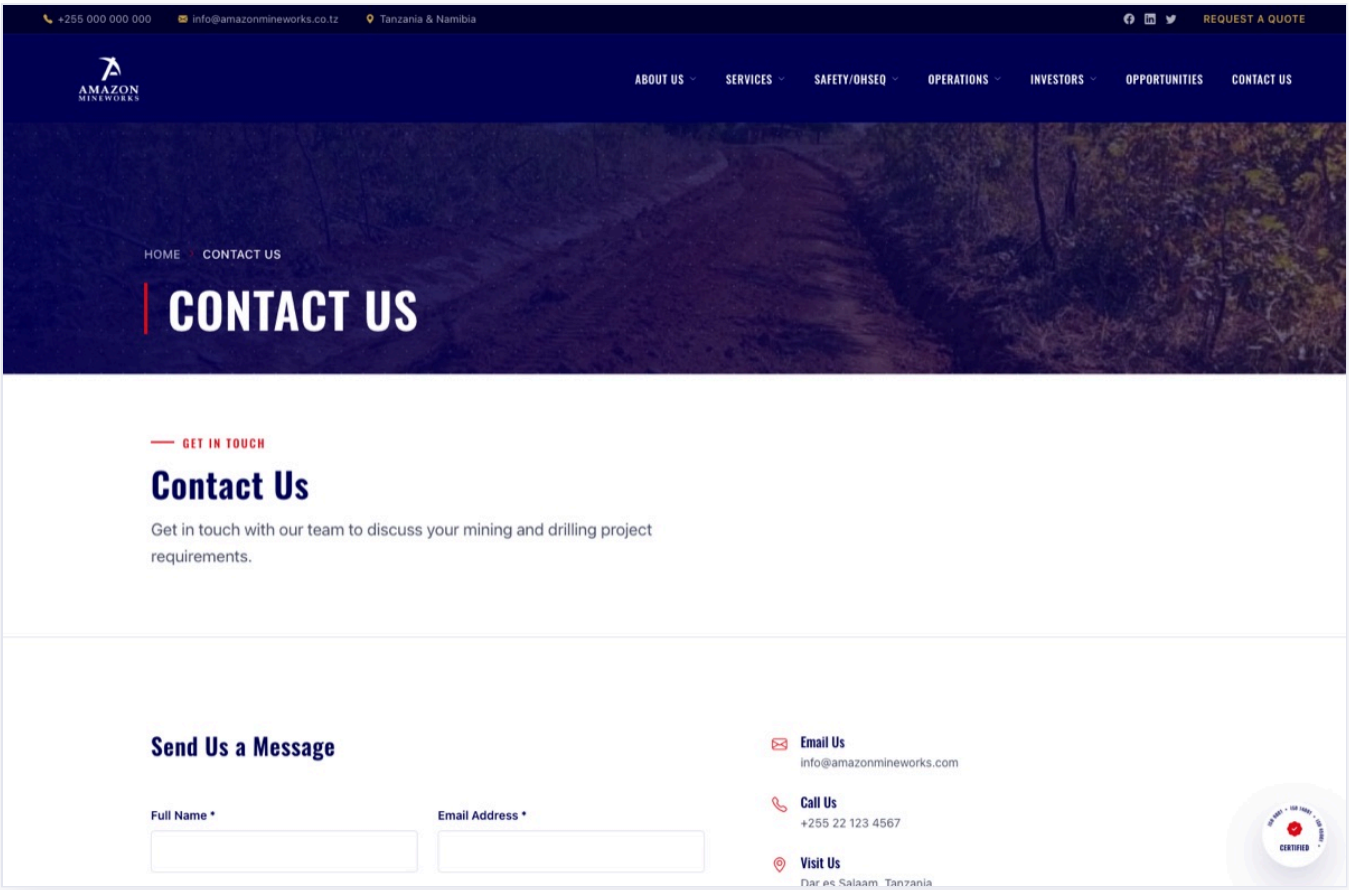

05 — PAGE WALKTHROUGH

Contact Us

/contact-us

A working contact form alongside direct contact methods, both office addresses (Tanzania and Namibia), and business hours — two columns instead of a single long scroll.

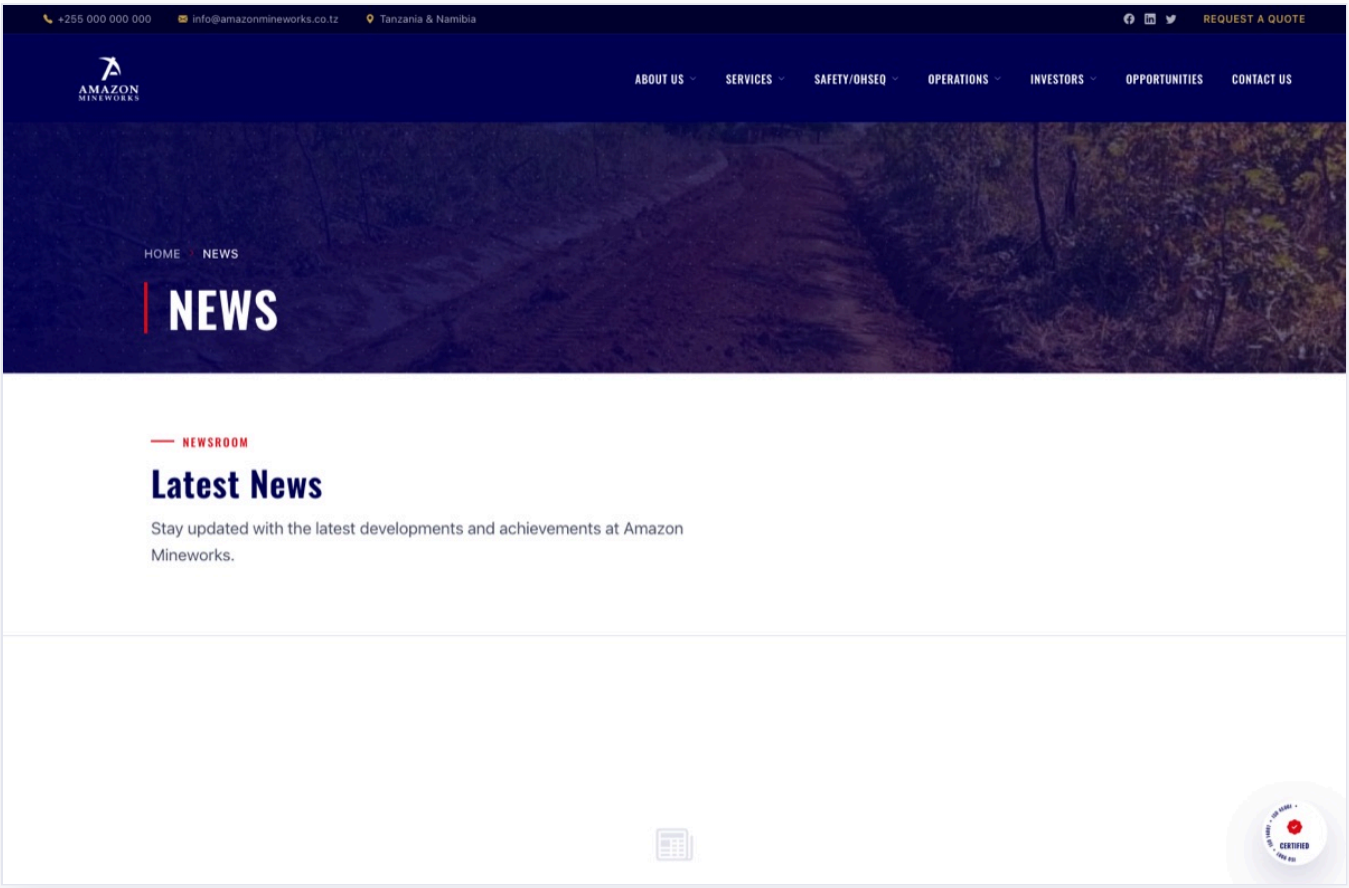

05 — PAGE WALKTHROUGH

News & Announcements

/news · /announcements

News is a proper article grid with individual article pages (share buttons, tags, real breadcrumb via the article's own title). Announcements is filterable by category, with the filter counts now computed from the real list instead of hardcoded numbers that didn't match it.

06 — CONTENT INTEGRITY

A few things we fixed along the way.

The brief was to preserve real content, not invent new facts. In a few places the existing content itself was the problem — either factually inconsistent with the rest of the site, or risky to publish as-is. Flagging these directly rather than quietly carrying them forward:

REMOVED	**A misattributed testimonial.** A quote credited to a named, real industry executive was praising a different real company by name — leftover copy from another contractor's site. Publishing it under Amazon Mineworks would have misrepresented that person's words.
FIXED	**A leftover competitor name** in the "Creating Career Opportunities" section, referencing a different company's strategy instead of Amazon Mineworks'.
TRIMMED	**The safety-milestone list** to Tanzania-only sites — the original mixed in Mali, Guinea, Saudi Arabia and Egypt, contradicting the Tanzania/Namibia footprint stated everywhere else on the site.
FIXED	**Announcement category counts** that were hardcoded to numbers not matching the actual list of announcements shown.
REMOVED	**A dead Blog page** with no real content and no links pointing to it, and a duplicate "Partner with a trusted contractor" banner that was rendering twice on every single page.

07 — WHAT WE STILL NEED FROM YOU

Closing the gap to launch.

The design and engineering work is complete and running. A short list remains that only the client can provide:

01 **Management team photos & bios**

The current entries are placeholder names and a generic silhouette image — real leadership photos and bios needed before this page goes live.

02 **Real contact number**

The phone number shown in the nav, footer and contact page (+255 000 000 000) is a placeholder.

03 **Additional site photography**

The site draws entirely on existing project photography. Fresh, high-resolution shots of current operations, equipment and crews would strengthen several sections further as they become available.

04 **Legal pages**

No Terms of Service or Privacy Policy content exists yet in the project — needed if the contact form or any data collection goes live.
